GEOLOGICAL SURVEY

ANALYSES OF ILLINOIS COAL AND ASSOCIATED ROCK SAMPLES  
COLLECTED IN 1975 AND 1976

by

CHARLES L. OMAN

U. S. Geological Survey Open-File Report 94-555

This report is preliminary and has not been reviewed for  
conformity with U.S. Geological Survey editorial  
standards, and stratigraphic nomenclature.

## Abstract

Chemical and geologic data are presented for 133 samples of coal and coal-associated rocks from Illinois. These data include sample site locations, stratigraphic position, air-drying loss, proximate and ultimate analysis, calorific value, forms of sulfur, initial deformation temperature, softening temperature, fluid temperature, free-swelling index, concentrations of major elements and minor elements reported as oxides, and trace elements.

## Introduction

From 1975 to 1976 members of the Illinois State Geological Survey (ISGS) collected 92 samples of bituminous coal and 41 samples of associated roof, parting, and floor rocks from 16 localities. The samples were collected to generate coal quality data for Illinois coals. These samples were analyzed by the U.S. Geological Survey (USGS) for major-and minor-oxides and trace elements, and by the U.S. Bureau of Mines for standard proximate and ultimate analyses, calorific value, forms of sulfur, ash-fusion temperatures, free-swelling index, and air-drying loss.

The USGS sample numbers, beginning with the letter D (figure 1) were analyzed using a scheme described by Swanson and Huffman (1976). The USGS sample numbers beginning with the letter W were analyzed according to the flow chart in Figure 2. Details on the analytical procedures used in this latter scheme can be found in Golightly and Simon (1989).

The sample locations are plotted in figure 3, and the sample descriptions are given in table 1 for 92 coal samples and in table 1a for 41 rock samples. Tables 1 and 1a include the USGS sample numbers, Illinois State Geological Survey numbers, latitude, longitude, geologic quadrangle name, county, coal bed name; table 1a also includes member, and zone. The samples are arranged

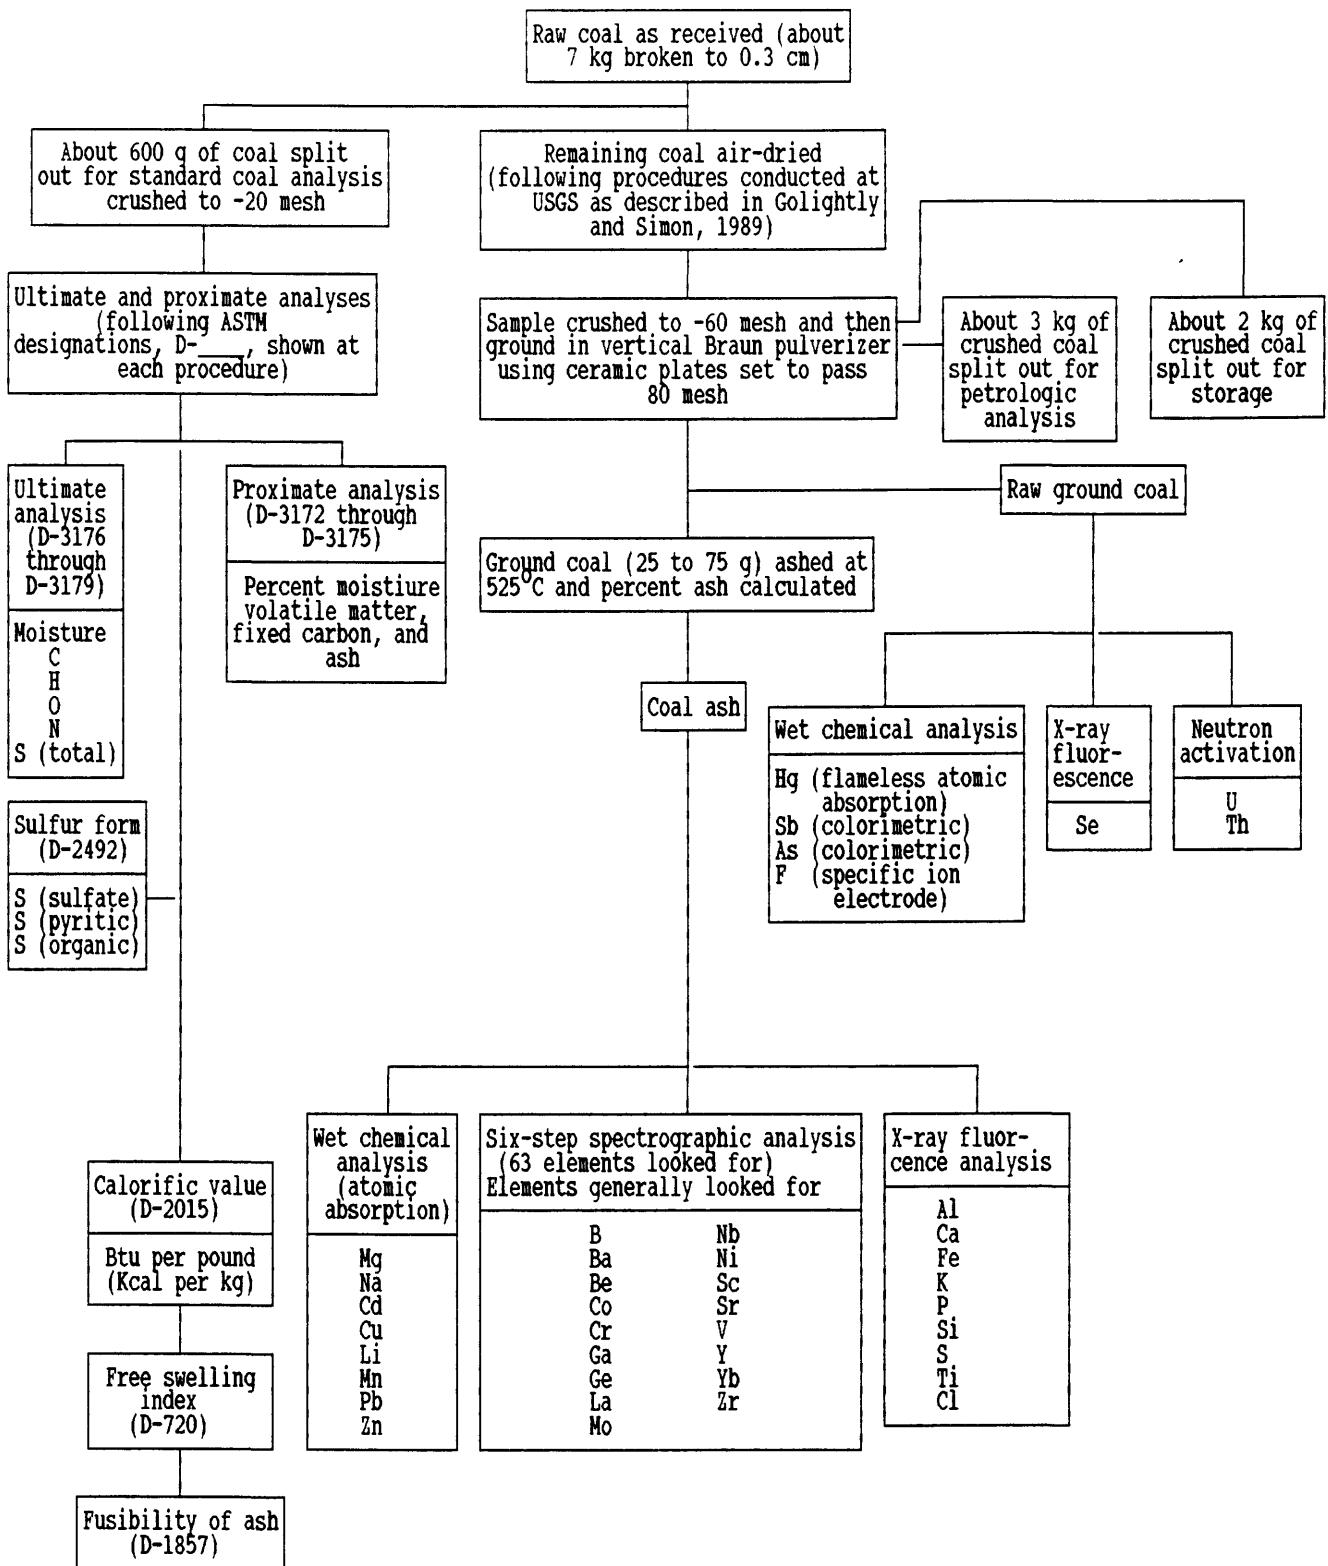

Figure 1. Flow diagram of procedures used for D samples, for the analysis of coal samples collected.

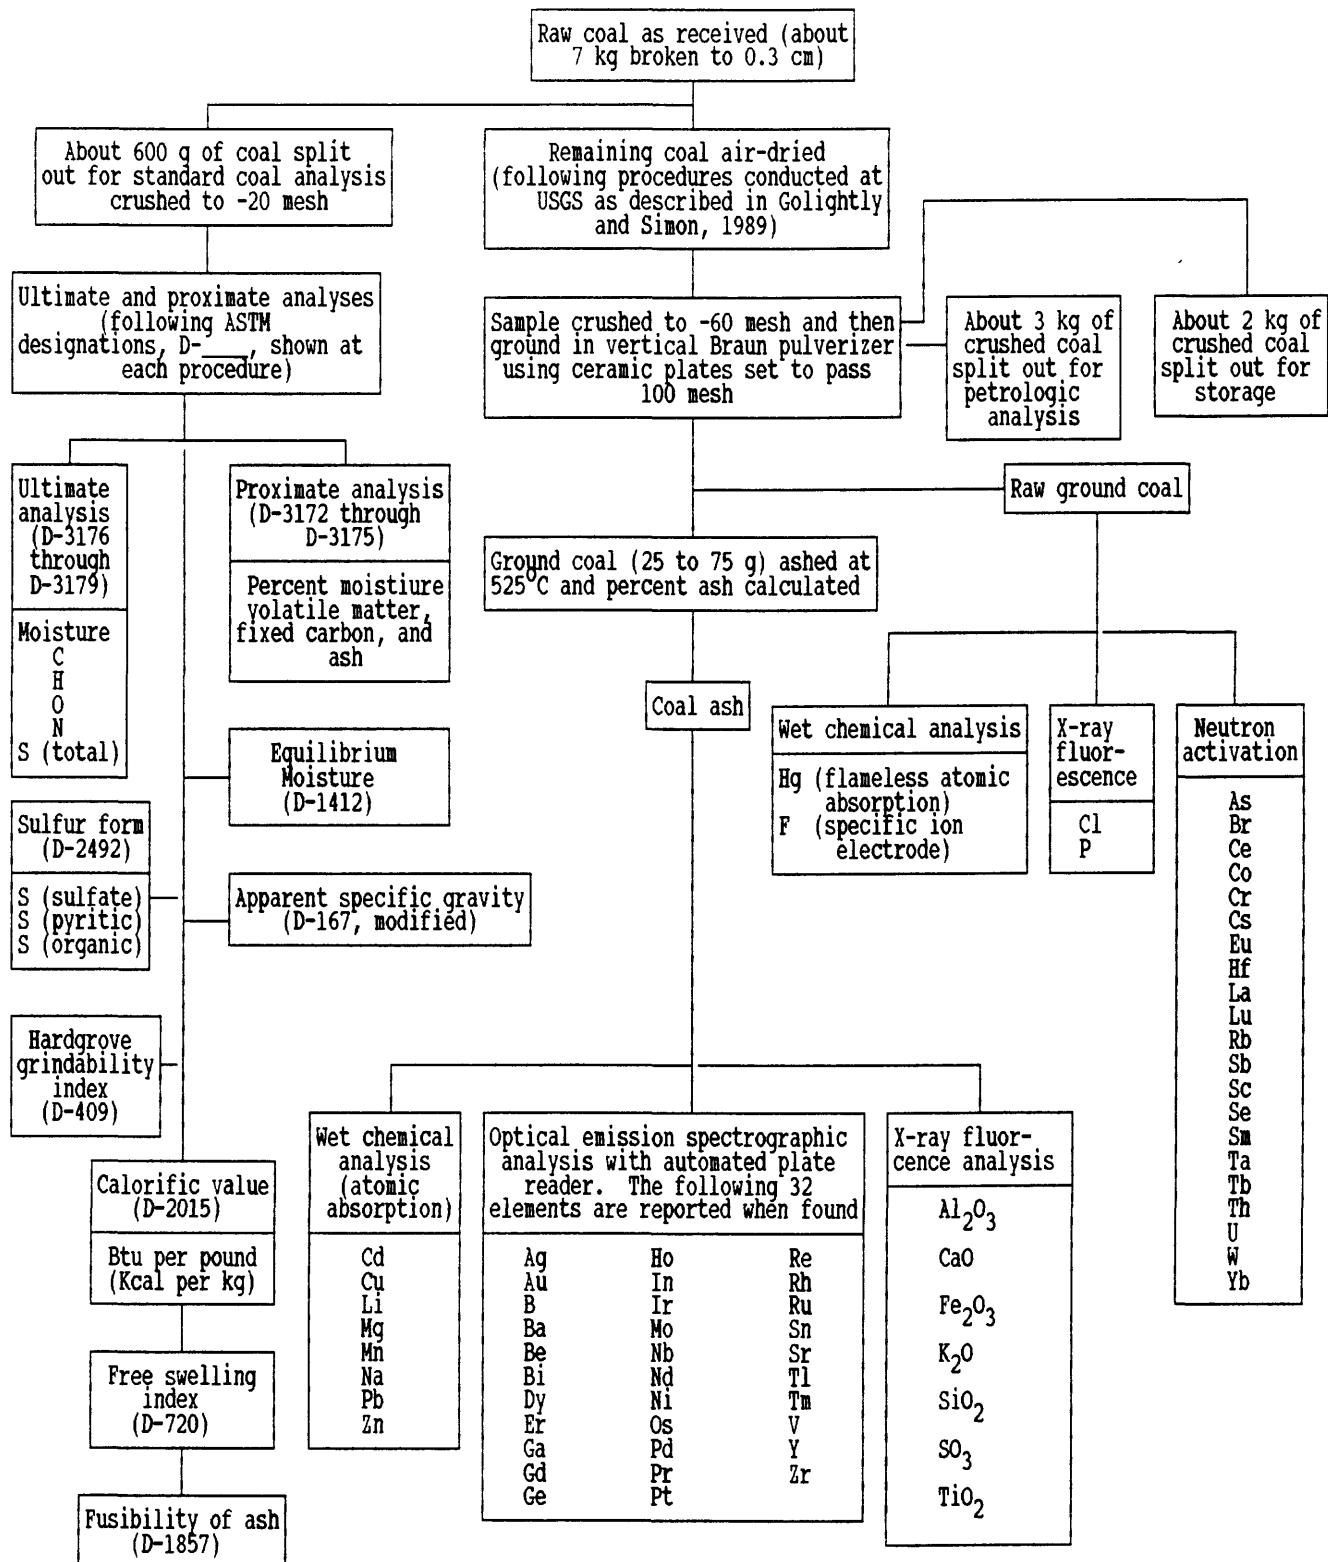

Figure 2. Flow diagram of procedures used for W samples, for the analysis of coal samples collected.  
(ASTM-American Society for Testing and Materials, USGS-United States Geological Survey.)

Figure 3. Sketch depicting sample localities in Illinois.

by county and sample locality.

The analytical results are shown in Tables 3, 4, and 5. Table 3 contains the major- and minor-oxides on an ash basis. Table 4 contains the trace element concentrations on a whole-coal basis. Table 5 contains data from ultimate and proximate analyses, calorific value, forms of sulfur, free-swelling index and ash-fusion temperatures. Tables 3, 4 and 5 contain coal data; Tables 3a and 4a contain data on the associated rocks.

Table 5 contains arithmetic means, minimums, and maximums for the Illinois samples identified as coal. A weighted average, (mathematically derived using bed thickness) was determined to provide a single channel sample for each location; for comparison the arithmetic means for the Illinois data published by Gluskoter and others (1977) are listed. The higher sulfate sulfur and lower calorific value are inferred to be the result of weathering or a longer storage time before the samples were analyzed.

Table 3.—Major-, minor-, and trace element composition of 92 coal bench samples from Illinois reported on a whole-coal basis. Concentrations in parts-per-million. I means less than the value shown; B, not determined. For elements by emission spectrographic analysis, the standard deviation of any answer should be taken as plus 50% and minus 35%. See figures 1 and 2 for individual element analysis. Sample number is USGS laboratory number.]

Table 4.—Proximate and ultimate analyses, calorific value, forms of sulfur, free-swelling index and ash-fusion temperature determinations for 92 bituminous coal bench samples from Illinois.

[All analyses except calorific value, free-swelling index and ash-fusion temperature in percent.

All analyses by Coal Analysis Section, Department of Energy, Pittsburgh, Pa. G for ash-fusion temperatures means greater than. Sample number is the USGS laboratory number.]

Table 4.—Proximate and ultimate analyses, calorific value, forms of sulfur, free-swelling index and ash-fusion temperature determinations for 92 bituminous coal bench samples from Illinois.—continued  
 [All analyses except calorific value, free-swelling indexes and ash-fusion temperatures in percent.  
 All analyses by Coal Analysis Section, Department of Energy, Pittsburgh, Pa. G for ash-fusion  
 temperatures means greater than. Sample number is the USGS laboratory number.]
